Your friend is typing his `name` into a keyboard. Sometimes, when typing a character `c`, the key might get *long pressed*, and the character will be typed 1 or more times.

You examine the `typed` characters of the keyboard. Return `True` if it is possible that it was your friends name, with some characters (possibly none) being long pressed.

Example 1:

Input: name = "alex", typed = "aaleex"

Output: true

Explanation: 'a' and 'e' in 'alex' were long pressed.

Example 2:

Input: name = "saeed", typed = "ssaaedd"

Output: false

Explanation: 'e' must have been pressed twice, but it wasn't in the typed output.

Example 3:

Input: name = "leelee", typed = "lleelee"

Output: true

Example 4:

Input: name = "laiden", typed = "laiden"

Output: true

Explanation: It's not necessary to long press any character.

Constraints:

- `1 <= name.length <= 1000`
- `1 <= typed.length <= 1000`
- `name` and `typed` contain only lowercase English letters.
